Note:

1. Please note that this is not the merit list. The merit list will be uploaded on the Institute website post verification of the online application and documents submitted by the candidates.
2. Candidates are required to submit their genuine queries/representations to the email **recruitment.nt@iisc.ac.in** by **11.10.2022**, after that no correspondence will be entertained.
3. If at any stage during the screening, recruitment, and selection process and even after appointment, it is found that the candidate furnished false/incorrect information, his/her candidature will be rejected/cancelled.

4. Information regarding the further stages of the recruitment process will be communicated through the Institute website and through the registered email id of the candidates. Candidates are requested to visit the Institute website regularly.
5. The normalization scheme adopted in drawing the final score as per standard norms is attached as **Annexure A**.

IISc Bangalore

Score Normalization

1. About Normalization

Normalization means adjusting values measured on different scales to a notionally common scale.

2. Need for Normalization in Exam

Exams pertaining to a particular post/course could be spread across multiple shifts which will have different question papers for each shift. Hence the normalization of scores needs to be carried out for all the candidates who had written the exam, across shifts for the same post/course.

3. Score Normalization Logic

For each shift, the average and standard deviation are calculated. Average tells us about overall scoring. Standard deviation tells about the spread of marks. Take the example below of one shift and see how the average and the standard deviation are calculated.

Sr. No.	X (Raw score)	$x = (X - X_{av})$	x^2
1	31	-34	1156
2	46	-19	361
3	40	-25	625
4	71	6	36
5	65	0	0
6	90	25	625
7	59	-6	36
8	84	19	361
9	99	34	1156
N = 9	Total = L = $\sum X = 585$		$\sum x^2 = 4356$

$X_{av} = L / \text{No. of candidates present for that particular shift} = 585/9 = 65$

$$\text{Standard Deviation} = \sqrt{(\sum x^2) / N} = \sqrt{4356/9} = \sqrt{484} = 22$$

As shown in the example above for one shift, the same process is followed for every shift to calculate the mean and standard deviation of each shift.

4. Choosing the Base Shift

Then to calculate the normalized score for each candidate, first, we need to consider one shift as the base shift. Statistically, any shift can be considered as a base shift because normalization will put all candidates properly in a relative position.

But to avoid the reduction in marks after normalization, we normally consider the shift with the highest mean as the base shift. Also, in a particular shift, if the number of candidates is too low, we may not consider that shift as the base shift (for statistical purposes) even if it has the highest mean. (Generally, this threshold is kept at 70%).

Normalized Score for each candidate (X_n)

To calculate the normalized score of each candidate, the following formula is used.

$$X_n = \frac{S_2}{S_1} * (X - X_{av}) + Y_{av}$$

S₂	Standard Deviation of the base shift
S₁	Standard Deviation for the candidate shift (to be scaled to S2)
X	Raw score of a candidate
X_{av}	Simple average of the candidate Shift
Y_{av}	Average of the base shift

Example

Please refer to the excel sheet below for the example of 3 shifts.

Example

Variation of Z-Score method

Some organizations use a slight variation of the Z-score method as given below.

Normalization mark of j^{th} candidate in the i^{th} session \hat{M}_{ij} is given by

$$\hat{M}_{ij} = \frac{\bar{M}_t^g - M_q^g}{\bar{M}_{ti} - M_{iq}} (M_{ij} - M_{iq}) + M_q^g$$

where

M_{ij} : is the actual marks obtained by the j^{th} candidate in i^{th} session

\bar{M}_t^g : is the average marks of the top 0.1% of the candidates considering all sessions

M_q^g : is the sum of mean and standard deviation marks of the candidates in the paper considering all sessions

\bar{M}_{ti} : is the average marks of the top 0.1% of the candidates in the i^{th} session

M_{iq} : is the sum of the mean marks and standard deviation of the i^{th} session

If you compare this formula with the standard Z-score formula, you can see that the overall structure is the same. In the normal Z-score method, where the average is used, in the variant formula, the sum of average and Standard Deviation is used. There is no specific base shift as such. But average and Standard Deviation of all candidates are considered as base.
